Text Books

- Main reference:
 - Compilers – Principles, Techniques and Tools, Second Edition by Alfred V. Aho, Ravi Sethi, Jeffery D. Ullman
- others references:
 - Modern compiler construction in Java 2nd edition
 - Advanced Compiler Design and Implementation by Muchnick
 - Cooper & Torczon, *Engineering a Compiler*

Course Contents

Ch1. Introduction

Ch3. Lexical analysis (Scanning)

Ch4. Syntax Analysis (Parsing)

Ch5. Syntax Directed Translation (Semantic Analysis)

Ch6. Intermediate Code Generation

Course Aims and Objectives

The Objectives of this course is to explore the principles, algorithms, and data structures involved in the design and construction of compilers.

Understand the Lexical and Syntax phases of a compiler.

Understand transformation of source code to parse tree.

Course Aims and Objectives

Learn Regular Expressions

Converting Regular Expression to Finite automata

Learn about Finite Automata

Lexical and Syntax analysis combination

The Aim of this course to learn and implement the Front Phase of compiler while the bakend phase is advanced topic

Grading policy

Abstract view

Front-end, Back-end division

Front end maps legal code into
IR(Intermmidate Representation)

Back end maps IR onto target
machine

Front end

Recognize legal
code

Report errors

Produce IR

Front end

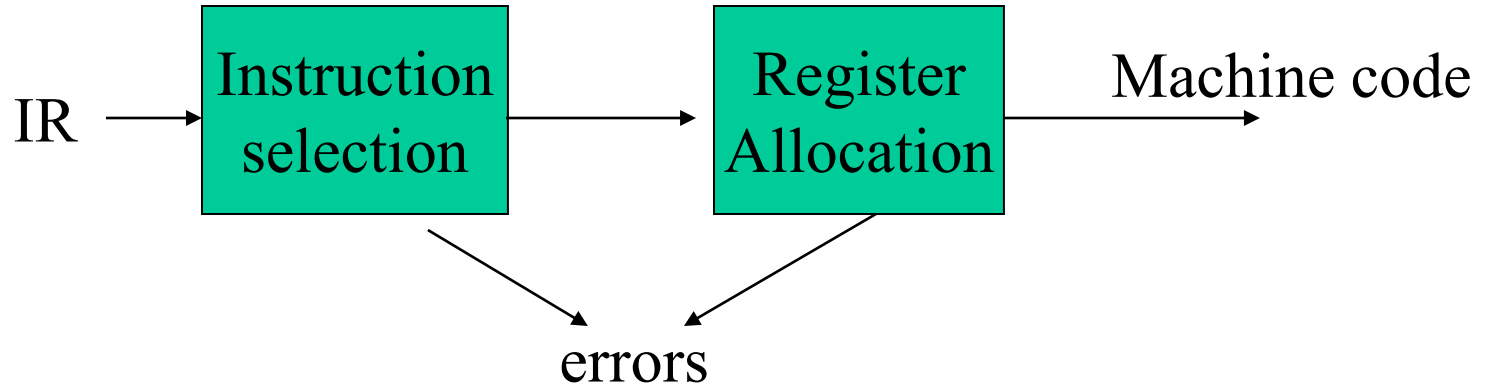

- **Scanner:**
 - Maps characters into tokens – the basic unit of syntax
 - $x = x + y$ becomes $\langle \text{id}, x \rangle = \langle \text{id}, x \rangle + \langle \text{id}, y \rangle$
 - Typical tokens: number, id, +, -, *, /, do, end
 - Eliminate white space (tabs, blanks, comments)

Front end

- Parser:
 - Recognize context-free syntax
 - Guide context-sensitive analysis
 - Construct IR
 - Produce meaningful error messages
 - Attempt error correction

Back end

Translate

Translate IR
into target
machine code

Choose

Choose
instructions
for each IR
operation

Decide

Decide what
to keep in
registers at
each point

Ensure

Ensure
conformance
with system
interfaces

Academic Integrity

We want a cooperative group
working together to do great stuff!

Possibilities include bounties for
first person to solve vexing
problems

But: you must never misrepresent
work done by someone else as
your own, without proper credit

OK to share ideas & help each
other out, but your project
should ultimately be created by
your group & solo homework /
tests should be your own

Readings for Next Lecture
